## **CLAIMS**

## What is claimed is:

- 1. A process for network video data transmission, comprising the steps of:
- 5 (a) receiving video data;
  - (b) transmitting the video data into buffer A;
  - (c) packing the video data and sending to a broadband Ethernet;
  - (d) receiving the video data and unpacking the video data into buffer B;
  - (e) transmitting the video data out;
- wherein buffer A and B are used for temporary storage for video data after packing and unpacking.
  - 2. The process of claim 1, wherein the process is for broadband Ethernet video data transmission.

3. A process for packet order control, comprising (a) checking a flag to guarantee data order; and (b) ignoring a mixed order instead of asking for resending.

4. A process for packet timing control, comprising absorbing unstable time delay.

- 5. The process of Claim 3, wherein the flag of a packet is circulated in the absence of a counter.
- 25 6. The process of Claim 1, wherein audio data of a scene will be copied and sent in all packets of said scene so that one correctly received packet may recover the audio information of the whole scene.
  - 7. A process for video data control, wherein old scene will be resent to video terminal if wrong packet were received or time delay is too long.
  - 8. The process for video data transmission of Claim 1 wherein at least one buffer is used to hold data temporarily to ensure that too short time delay can be absorbed.
